

Andreas AUER Belt Grader

If materials are very similar in size, weight and color, but differ in their rolling behavior, these materials can be separated using a bias belt sorter. The items to be cleaned are guided onto the belt, which moves to the right. Due to the surface of the belt and its movement, materials that do not roll easily are pulled further to the right by the belt. The material with good rolling behavior, on the other hand, runs vertically downwards. By adjusting the inclination and speed of the belt, the result can be optimally adapted to the culture. This technique is best suited for cleaning sorrel seeds from clover.

Gewicht	275 kg
Stromaufwand	0,37 Kw
Länge	1400mm
Breite	1200 mm
Höhe	1620 mm
